## Zte z64 bands

Home T-Mobile 4G HotSpot Z64 Zoom Sale Details T-Mobile 4G Hotspot Z64 is a mobile pocket router based on Qualcomm MDM8200A Chipset and supporting up to 8 Wi-Fi-enabled devices to access internet in high speed. The ZTE Z64 hotspot has a 1.4" OLED LCD screen where many important information would be shown. T-mobile Z64 4G hotspot could support peak download speed to 21Mbps and WiFi 802.11 b/g/n only on single band 2.4GHz. The battery capacity is 2300mAh, which is enough for common use. T-Mobile 4G Mobile Z64 Technical Specifications: \* Type: 4G Mobile WiFi Hotspot \* Chipset: 256MHz, Qualcomm MDM8200A \* 3G UMTS/HSPA- 850/AWS/1900MHZ \* 2G GSM/EDGE-850/1900MHz \* 3G HSPA+ Peak download speed to 21Mbps \* Wi-Fi: 802.11 b/g/n, 2.4GHz \* Support up to 8 wireless users \* Internal: 64MB RAM + 128MB ROM \* Battery capacity: 2300mAh \* Compatibility: Windows 7/8, Mac OS, Linux \* Dimensions: 3.9 x 0.53 x 2.5 inches \* Weight: 3.7 ounces ReviewsTags You may also be interested in the following product(s) © 1996-2014, Amazon.com, Inc. or its affiliates Bei AliExpress.com willkommen Welcome back Abmelden Registrieren Anmelden At your doorstep by May 05 to May 08 with standard deliveryGoogle Fi SIM Card KitBy google Hello everybody ,I have an unlocked z64 Tmobile hotspot 4g. I need to use it on 900/2100 frequency. But its originally on 850/1900. Since its based on MDM8200A Qualcomm chipset.Do you think its possible to enable all bands with DFS or QPST? Page 2 Yeah I think so too. Right now I don't think this vpn service can be used with the nexus 4. Thank you so much for your extremely concise and simple explanation of the networks. I felt like a 9 year old kid grappling with the subtleties of my parents budget choices trying to figure out how to get my tether back. I lost my my touch 4G on a rafting trip and found out afterwards from a tmobile rep that they didnt have anyway to check that particular phone for the tethering. So basically I didnt have to actually be paying for the service on that phone like i was but now the replacement phone(HTC Amaze 4G) never worked and i could never get them to tell me why it worked on my other phone but not this on. After reading different forums and such like this it gets clearer and clearer. Thanks again for ur help. Since I couldnt get my wifi tether to work with this phone I dropped it from my plan and opted for the unlimited data! Now Since they screwed me without lube for 3 months im gonna hopefully be able to return the favor!----- Post added at 11:13 PM----- Previous post was at 10:38 PM----- You actually set up your home network to host you own personal VPN. So no matter where you are, your phone would always use your home network. Your phone will still use the service provider's data service, however, it would use it only to connect to your VPN at home and then securely reroute that data back to your device. So as all of the data is moved along T-Mobile's servers the data in your VPN cannot be read by tmobile's filtering process. So one personal vpn server would be all you need. There's an option if you check your "settings" -> more settings -> VPN" that will let you use a VPN for all connections on your device. Let me know if there's anything I can clarify. Sent from my SGH-T999 using xda premium Well I tried it on my spare laptop tethered to my HTC Amaze 4G and where before it would turn on but not connect, it actually connected. When speaking with customer assistance not to long ago the rep told me that and some specific date i attempted to access Tmobile Hotspot. If he was able to see that on his computer then my question is this: Will They see that my hotspot was activated and used for any period of time and if so will they rake me over the coals and give me fifty lashes Or smack me with some absurd over charge and change my data plan? I have this question bouncing in my head and am new to this whole forum idea so i thought i would throw that question out there. Thanks! What I can't wrap my head around is why I can't do a stock Wi-Fi tether while being connected to a VPN. Does the app check network provisioning prior to allowing traffic to be passed? If so, why can't the provisioning be faked? If it's a simple poisoning of DNS, that should be pretty easy to bypass, no? This method works, but I guess its better to use your own VPN instead of VPN1Click. How are you guys setting up your own VPN with Windows ?? What I can't wrap my head around is why I can't do a stock Wi-Fi tether while being connected to a VPN. Does the app check network provisioning prior to allowing traffic to be passed? If so, why can't the provisioning be faked? If it's a simple poisoning of DNS, that should be pretty easy to bypass, no? I'm using Darth stalker and Jovy23 modded the built in hotspot app to work. He bypassed provisioning and removed data thrtling. He also created a how-to page for other devs to do it to their ROMs Sent from my SGH-T999 using xda premium This is all very interesting OP. Thanks for the update. For rooted users only? For all of the T-Mobile users who are still trying to find a way to circumvent the user agent checking that T Mobile while using the native hotspot app and don't feel like decompiling, editing XMLs, and recompiling, or messing with editing APNs, or ETC... A simple solution that I'm using: use a VPN. Search the market for: VPN One Click organic&utm\_term=one+click+vpn+android Also don't use the native hotspot, if you're on the Galaxy S3 and JB use this app by TrevE All others that are capable use wifi tether for root users. ... 1 - Start VPN One click. 2 - Select a "Random Server" 3 - Wait for connection to establish and a "key icon" to show up in your statusbar. 4 - Start WiFi Tether for Root Users or TrevE Mod which ever you're using. 5 - Configure wifi tether settings. [For SGS3 users on JB, I've found the best setting to use is as follows: Device Profile: Generic ICS/JB (wlan0) Setup Method: Auto Wifi Encryption: Unchecked/OFF SsID: (whatever you wanna use) Don't disable bluetooth: Unchecked Wifi driver reload: Checked Enable Access-Control: Checked MMS Clamping: Checked Routing fix: Checked THE IMPORTANT PART! - AFTER A DEVICE CONNECTS AND SHOWS UP IN YOUR STATUSBAR YOU MUST EITHER FOLLOW THE NOTIFICATION AND SELECT THE DEVICE AND HIT THE "APPLY" BUTTON AT THE BOTTOM OF THE SCREEN TO GRANT INTERNET TO THE TETHERED DEVICE. Sorry for the all caps moment but alot of people tend to not remember this vital step... smh...] 6 - Tap icon to start tethering. Once all of the messages stop popping up... Enjoy! Used it to watch movies yesterday so its fairly stable! If you wanna setup your own personal VPN - G.I.Y.F. (Google is your friend) Search for OpenVPN methods. PPTP also works. Im just a little too lazy to type the instructions, I've just got done unloading a moving truck. ☹️☹️☹️ Also I'm using FrostyJB if anyone has an issues where its not working on their device. - Sent from my SGH-T999 using xda premium Is there another app to use? This hotspot app is for rooted users. I'm looking for solution for unrooted. Maybe i didn't see. New here. Sorry for being away for so long! I tested with the native app, but it doesn't connect to the internet. So that's that. With Wifi Tether for Root Users, it worked once but in a very flaky way. After that one time, couldn't get it working again. Tried many different profiles, and the one in which I don't get any log errors is forcing the generic one, forcing one of the setup methods. Apparently it doesn't work with the N4, there's another N4 user in the reviews that has problems too. Another very similar app is Open Garden's wifi tether, but it seems to be pretty much the same app as Wifi Tether for root users, has an almost identical interface and options. And of course, also doesn't work. Barnacle is another that doesn't work with the N4. By the way, this is all without even using VPN, so those aren't viable for us with the N4. Have you tried one of the TrevE Mods? he modified Wifi Tether specifically for Samsung devices on 4.x.x - the original Wifi Tether for root users from the Play Store has issues with JB and Samsung. Let me how it turns out if you haven't tried it yet. Hey, thanks for the info. If you're using a VPN it should work with most wifi tether apps though, shouldn't it? I'm on a N4 and CM10.1, which I guess should have about the same tethering app as the stock firmware. Also, it should work with BT tethering, shouldn't it? Another question, is VPN One Click really free, or is there a catch? My router doesn't seem to have the VPN option you mentioned before, and my home internet appears to be 15mb down, but only 1mb up, which would limit considerably my speed even if I did a personal VPN. As long as the tethering app is a 3rd party one in my case, all the modded/edited stock WIFI hotspot apps did nothing for me and wouldn't allow me to connect to a single VPN. I think it's mainly in part to the different APN the native hotspot tries to connect to, even after removing the apn from the xml in my framework-res.apk and removing the TetheringProvision.apk it still swung me into the upsell page, but I found that all 3rd party tether apps work just fine. Oh, and bluetooth tethering works with a VPN. Basically it creates a Personal Area Network (PAN) and forwards all net request to make it seem as if your phone is doing all the browsing, so the downside is that some apps won't even recognize its connected to the internet, but it works! Possibly it's because the app hasn't been updated in months and is not playing well with 4.2.1 or having encryption issues with the native app. Sent from my SGH-T999 using xda app-developers app That is true, I've updated the repost with new software and a more in-depth guide. Thank you so much for your extremely concise and simple explanation of the networks. I felt like a 9 year old kid grappling with the subtleties of my parents budget choices trying to figure out how to get my tether back. I lost my my touch 4G on a rafting trip and found out afterwards from a tmobile rep that they didnt have anyway to check that particular phone for the tethering. So basically I didnt have to actually be paying for the service on that phone like i was but now the replacement phone(HTC Amaze 4G) never worked and i could never get them to tell me why it worked on my other phone but not this on. After reading different forums and such like this it gets clearer and clearer. Thanks again for ur help. Since I couldnt get my wifi tether to work with this phone I dropped it from my plan and opted for the unlimited data! Now Since they screwed me without lube for 3 months im gonna hopefully be able to return the favor!----- Post added at 11:13 PM----- Previous post was at 10:38 PM----- Well I tried it on my spare laptop tethered to my HTC Amaze 4G and where before it would turn on but not connect, it actually connected. When speaking with customer assistance not to long ago the rep told me that and some specific date i attempted to access Tmobile Hotspot. If he was able to see that on his computer then my question is this: Will They see that my hotspot was activated and used for any period of time and if so will they rake me over the coals and give me fifty lashes Or smack me with some absurd over charge and change my data plan? I have this question bouncing in my head and am new to this whole forum idea so i thought i would throw that question out there. Thanks! Yea, the MT4g originally was released with i believe Froyo (Android 2.2) and went through Gingerbread (Android 2.3.x), Honeycomb (3.x.x) ICS (4.0.x) and finally made it to JB (4.1.x) ports. it wasn't until Ice Cream Sandwich (4.0.x) that T-Mobile started to implement the tether provisioning.apk and tethering APN. Tmo can see you tether when you use the native hotspot because it connect to the tethering APN pcwebs.tmobile.com unlike the old wifi hotspot apps before 4.0.x which used the same APN as your phone: epc.tmobile.com So, as long as you use a 3rd party tether app, Tmo won't be able to see your tethering usage, it appears to them as if you just use a lot of data on your device. I hope that makes sense. I use to work for T-Mobile, lol, actually ... I had T-Mobile when they were known as Voicestream! samsung galaxy S3 SGH-T999 tethering no detection option that works on the samsung galaxy s3 SGH-T999 for tethering use the clockwork app USB tethering and use VPN option in the phone make sure that the VPN is encrypted PPTP connection this works and even works with internet explorer it solves most of the issues, as for 3rd party wireless tether i have not tested that yet it depends on how the data is routed in the phone but this works i would put VPN's but ill leave that to you it works well tested tough and working, with toughbook laptop and also using explorer and also using youtube and more, speed depends on VPN you use im using the VPN option in the phone to redirect traffic works very well. Last edited: Apr 1, 2013 This is true, its not that bad of a lag for me here in Chicago however, normally my download speeds are between 5-7 Mbps on 4G, with the VPn running I drop to 3-5 Mbps, but I've kinda tweaked the tether apk to start OpenVPN when tethering starts and to disconnect when I turn off tethering. So for the most part I never notice the hit on my speed, I've configured packet compression on my personal VPN server. I'm using a Linksys E4200 on AT&T U-Verse. Thanks for pointing that out for me by the way Reilly, I know I've forgot to list the pros and cons of a vpn. I have a few minutes in my hectic life to hop on xda and make a few quick posts but never enough time to go into detail and proof-read my own posts. Sent from my SGH-T999 using xda premium While you used to work for T-Mobile, I used to work for AT&T U-Verse, and I'm letting you know you need to be extremely careful with your data usage. While you're on T-Mobile's unlimited 4G plan (no cap that i've found), U-Verse is capped at 250gb total (this includes upload and download) transfer. While you're using VPN, every byte you transmit in, you're transmitting back out, so you're effectively doubling your data usage on your U-Verse line. When you're using tethering, for every MB you use, you're burning an extra MB, so downloading a 3mb file is now burning 6mb of transfer on your U-Verse. Example: T-Mobile phone makes request for 3mb file via VPN. VPN tunnel makes same request for 3mb file on your behalf. You're counted for 3mb download on U-Verse, your VPN tunnel now transmits that 3mb via VPN to your T-Mobile, you're counted for another 3mb for the transmit, plus overhead for the VPN encryption (which would make it just a tiny bit over 3mb since you're using compression). If you manage to transfer 125GB of data on your T-Mobile VPN connection, you're burning all 250GB of transfer cap you have on U-Verse. Other users of other services that are not truly unlimited (U-Verse, Comcast, Charter, Time Warner (any branch), CenturyLink, countless other telco/cablecos), you're screwing yourself. And if you're doing this because you use your computer a lot on the go, it's likely you use your computer just as much at home and are getting either close to, or have gone over your cap at least once. Be VERY careful with your usage, and remember that when you're using your VPN, you're using double data on your home connection! Providers do not tell you, but they count that 250gb cap with BOTH directions, not just "download" like they say (total BS in every single incident). Reactions: Reilly1812 well you may be right about that but to be all honist with every one nothing is truly unlimited any more but my issue is my privacy if there sniffing traffic it will be very hard for T-mobile to sniff my traffic for sure plus block any thing im doing because im using heavy encryption on my system unbreakable encryption thats all ill say. I love how people say this stuff, and come in with vague gloating like this in particular (see: "1-upping"). Complete waste of time as you need to contribute something with your post or it can be removed, however I'll refrain from reporting your post-count bump to make an example of you, further, I want my 10 seconds and 10 braincells you murdered back. T-Mobile just man-in-the-middle'd your VPN handshake and is now authenticating on your behalf to capture all your traffic in real time. Smart move. VPN only works so far until they break the law in order to take you down. Word of advice: If it was created by man, it can be defeated by man. This includes encryption, all it takes is time, and time is something of which THEY have plenty, and YOU have little. In response to the unlimited, I have unlimited transfer on my home internet connection, business class or not, and on the unlimited data plan, I've blown well past the normal 5gb cap and used almost 10 in one month, unlimited as far as I can tell. Last edited: Apr 10, 2013 T-Mobile just man-in-the-middle'd your VPN handshake and is now authenticating on your behalf to capture all your traffic in real time. Smart move. VPN only works so far until they break the law in order to take you down. Word of advice: If it was created by man, it can be defeated by man. This includes encryption, all it takes is time, and time is something of which THEY have plenty, and YOU have little. I run my VPN with a 2048 bit AES encryption key. AES is a type of symmetric encryption developed to defeat said man in the middle attacks. That means there is no key sent over the internet. Only the source and destination have the keys, and they are never shared. That means the only option to break an AES key is brute force. Do you have any idea how long it takes to brute force a 2048 bit AES key? Even if we go with lucky guess estimates, we're talking 20 years of full-time work by one of the world's top ten super computers. Possible? Yes. Likely? No. Now I don't know what kind of keys everyone here is using for their private VPNs, but you should be using AES. RSA is a type of asymmetric security, which means the key is shared over the internet. While it's still unlikely that the key will be intercepted the moment it is sent, it is possible. The advantage used to be that it is easier to set up, but OpenVPN has made that nearly moot with it's one file configuration system. Export the config, and you've got the server info and the keys all in one file ready to go. Just import that file on your phone using the OpenVPN app, and you're done. Incredibly simple. Also, I believe OpenVPN offers AES keys by default these days, since they're considered the more secure option. I run my VPN with a 2048 bit AES encryption key. Also, I believe OpenVPN offers AES keys by default these days, since they're considered the more secure option. You are credible, and this was not an attack on you or other security conscious people, do not take this as a direct attack on you. This is still trying to 1-up though by flaunting knowledge of the tech however, so bonus points for sharing the info, but lost points for being the old me. Minus 10 points from Hufflepuff. This did not work.... Time for me to update this thread! For all of the T-Mobile users who are still trying to find a way to circumvent the user agent checking that T-Mobile does while using a third party hotspot app and don't feel like decompiling, editing XMLs, and recompiling, or messing with editing APNs, or ETC... A simple solution that I'm using: use a VPN. Search the market for: Hotspot Shield ▼▼▲▲ All DO NOT use the native hotspot, I state this because of all the edits I've tried, the native hotspot still connects to the APN: pcwebs.tmobile.com instead of epc.tmobile.com - Which sniffs out the user agent of your browser and sends you to the upsell page. If you're on the Galaxy S3 and JB use this app by TrevE ▼▼▲▲ All others that are capable use Wifi Tether for root users. ▼▼▲▲----- tether settings. [For SGS3 users on JB using WifiTether, TrevE Mod Version 3.2-Beta2-041713, I've found the best setting to use is as follows: Device Profile: Generic ICS/JB (wlan0) Setup Method: Auto Wifi Encryption: Your Preference SsID: (whatever you wanna use) Don't disable bluetooth: Checked Wifi driver reload 2: Checked Enable Access-Control: Checked MMS Clamping: Checked Routing fix: Checked ----- 5 - Tap icon to start tethering. Once all of the messages stop popping up... Enjoy! Also I'm using the following setup: Device: SGH-T999 ROM: Synergy (R484) ► Kernel: Faux (OC'd 1.62 GHz) ► Modem: UVLI8 ► Data Plan: Unlimited Nationwide 4G \*UVLI8 happens to be the best modem for the areas that I frequent, which ranges from Waukegan all the way to downtown Chicago; it keeps me on HSPA+ 85-90% of the time. So experiment and find out which modem works best for you in your area. ►► Here's a map to help you guys get started on finding the right modem for you. ----- Critical Error | VPN API is not available on your device. | Unable to find explicit activity class | {com.android.vpndialogs/com.android.vpndialogs.ConfirmDialog}, Have you | declared this activity in your AndroidManifest.xml? | ----- It, in my case, is caused by having Xposed Framework installed. The only fix i've found for it was to Titanium Backup my apps, then uninstall the Xposed Framework - requires you to boot into recovery and flash the zip file "Xposed-Disable-CWM.zip" then you have to Wipe Data/Cache/Dalvik/Fix Permissions, flash your rom again, and restore from TB. Sent from my SGH-T999 using xda premium This did not solve my issue. I do have a SungSonic custom ROM. So this must be the reason right?
